

File Component

The FileComponent displays information about a file, including its name, title, and size, as well as an icon representing its type. It also includes a download button that triggers a function passed down as a prop.

Import Statement

```
import FileComponent from './FileComponent';
```

Props

Name	Type	Required	Description
data	object	yes	An object containing information about the file to be displayed. It includes the file name, title, and size.
downloadFile	function	yes	A function to be called when the download button is clicked. It triggers the download of the pdf file.

Example

This example shows how the File Component can be used to display user documents.

```
import React from 'react'
import FileComponent from './FileComponent'

const data = {
  fileName: 'example.pdf',
  title: 'Example PDF',
  size: '2.5 MB'
}

const downloadFile = () => {
  // function to trigger file download
}

function App() {
  return (
    <div>
      <FileComponent data={data} downloadFile={downloadFile} />
    </div>
  )
}

export default App
```
